The application was designed to:

- Run SQL query processing that involves the use of multiple SQL databases
- Automatically perform the required changes to the database connection string
- Retrieve and display the output files that have been yielded
- Display the processed SQL file character and line break characters
- Control the execution environment
- Provide statistics for the generated output files
- Provide a clear view of all the elements that are involved in the processing
- Automatically change the database connection string
- Automatically change the database character set
- Control the progress of the files being processed
- Display the results in CSV and SQL format
- Manage the database server running process from a list
- Retrieve the status of the running database process
- Display database, transaction, log and file statistics
- Change the access time of the monitored database
- Enable the execution of SQL queries on multiple databases
- Include all the scripts of the registered SQL files
- Enable real-time monitoring and tracking of the progress of the database execution
- Provide a timeline of all the transactions that were added
- Run the queries in the specified database
- Enable the execution of the scripts in UTF-8 format
- Monitor and track the file system status for all the monitored database files
- Retrieve the file name and location
- Display the statistics of the registered files
- Retrieve the statistics of the databases
- Control the file size and file naming
- Select the monitoring interval of the monitored database
- Control the monitoring of the servers (online/offline)
- Control the logging of the data
- Enable the monitoring of all connected databases
- Control the logging of the file system
- Enable a global search for the registered SQL files
- Enable the global search for the registered SQL scripts
- Change the file name of the monitored files
- Change the file name of the registered scripts
- Enable the ability to change the character set
- Enable the ability to change the SQL version
- Enable the ability to change the database character set
- Display the names of the databases in the specified SQL file
- Display the names of the registered SQL files
- Enable the ability to edit the registered SQL files
- Display the names of the monitored database files
- Display the names of the registered SQL scripts
- Enable the ability to edit the registered SQL scripts
- Change the file name of the monitored files
- Change the file name of the registered scripts

SQLBatch Runner

This software utility provides a high level of access to multiple SQL Server databases simultaneously, allowing users to execute multiple SQL batches simultaneously. SQL Server database management is one of the most common applications that require the use of multiple structured query languages at the same time. The task of data processing is greatly simplified when multiple SQL server databases are managed at once. Executing several SQL files at once on multiple instances of a SQL Server database may be a little tedious. The more efficient way to manage it is to use SQLBatch Runner Crack. The development of this tool is designed to allow users to run several SQL files on multiple instances of SQL Server databases. - The application is designed to ease the process of executing multiple SQL files on multiple instances of SQL Server databases. - Batch running of multiple executions is supported. - A database list offers a view of all the connected databases (both local and remote), an execution log provides insight into all the steps undertaken during the processing and the SQL file list will display all the used structured query languages. - A results panel will display the path for the yielded files and their timestamp characteristics and other relevant messages. - The latest version of the app offers support for UTF-8 format files which lack BOM markup as well as improved interaction. Features: - Compatible with SQL Server 2000 up to 2016 - Excellent user interface with integrated mouse gestures for navigation. - Multi-panel layout with individual components for each option. - Save and load multiple sessions for each target database. - Included services for tracing the SQL statements and restoring the SQLBatchRunner to a previous session. - Local installation. - Runs on any Windows version since XP. Supported Windows OS: Windows 2000, XP, 7, 8, 8.1, 10 System Requirements: - Multiple SQL Server databases. - SQL Server 2005/2008/2012/2016 and SQL Server Management Studio. - 32-bit/64-bit operating system. License: - Free of charge. SQLBatchRunner (SQLBatchRunner.msi) is a feature-rich tool for SQL Server, based on a multi-panel layout, which allows to run queries on multiple SQL Server databases. SQLBatchRunner supports the following features:

- Database List. The Database List panel provides a view of all the connected databases (both local and remote) and allows you to specify the target SQL Server database. SQLBatchRunner also provides a view of all the stored procedures and functions in the database (whether locally stored or stored remotely).
- Execution Log. The Execution Log panel provides a list of all the executions that took place in the target SQL Server database.
- SQL File List. The SQL File List panel provides a list of all the SQL files in the target SQL Server database. This includes local SQL files stored on your hard drive and remote SQL files stored remotely.
- Results. The Results panel displays the path of the yielded files and their timestamp characteristics as well as other messages. In addition to the above, SQLBatchRunner also includes the following features:
- Batch Setup. SQLBatchRunner provides an easy-to-use wizard to setup and configure your database server and allow you to run queries on multiple instances of SQL Server databases.
- Multi-panel Layout. The application is designed in a multi-panel layout so that it allows you to visually display the status of all the elements that are involved in the process of SQL query processing.
- Database Configuration. SQLBatchRunner provides you with several options regarding database configuration, namely - Database name, URL of the database server and the database connection user.
- Transaction Protection. SQLBatchRunner also provides several options for transaction protection. For example, users can select to start a transaction on a single SQL Server database or on a group of SQL Server databases.
- Language Encoding. The application provides you with various options for language encoding. The application allows you to specify a connection, server or database server. You can also specify the SQL character set, SQL collation, SQL code page, Unicode support and Legacy character set.
- Setup Multiple SQL Servers. SQLBatchRunner also provides you with options for using multiple SQL Servers. You can specify whether you want to run the queries on a single SQL Server instance, several SQL Server instances or a SQL Server instance and a SQL Server instance located remotely.
- Parameterizable Queries. SQL
